# Annual Fresh Deciduous Fruit Report 

## Report Categories:

Fresh Deciduous Fruit

## Approved By:

Clay Hamilton, Agricultural Minister Counselor

## Prepared By:

Priscila Ming, Agricultural Specialist

## Report Highlights:

For calendar year (CY) 2016, Post revised its apples production forecast down to 1 million metric tons (MMT), an 18 percent drop. The decrease in apple production is a result of unfavorable weather conditions and an ongoing decline of planted area. Apple imports increased 99 percent reaching 82,368 metric tons (MT) in CY2016. Total fresh pear imports were projected to drop 14 percent in CY 2015 to 179,306 MT when compared to the previous year. On the other hand, a 6 percent increase is estimated in CY 2016, reaching 205,000 MT of imported fresh pears. For grapes, production is projected to decrease significantly to $959,482 \mathrm{MT}$ from the past estimate of 1.4 MMT , as a result of the weather problems experienced in 2015.

## General Information:

Apples

## Area:

Total planted area for apples in Brazil in 2016 is estimated to decrease to 34,664 hectares, a 4 percent decline, as the planting of new trees is limited by the higher costs of production. Planted areas for apples have been following a downward trend during the past few years. The reason for the reduction in the area is mainly driven by three factors: economic problems in the sector, severe weather conditions, and the eradication of old orchards, which were showing low productivity in recent years. Some producers claimed dissatisfaction with the profit margins, and did not show any interest in replacing eradicated trees and planted other crops instead.

Santa Catarina continues to be the main apple-producing state in Brazil, accounting for 48 percent of total area, followed by Rio Grande do Sul with 47 percent. Brazil mainly produces three varieties of apples: Gala, Fuji and Eva.

## Total planted area for apple production

## Production:

In calendar year (CY) 2016, fresh apple production is expected to reach a total of 1.0 million metric tons (MMT), an 18 percent decline in volume. The major producing regions for apples, during the Brazilian winter and spring (Jun-Nov), experienced unfavorable weather conditions. Due to these severe adverse weather conditions, the production decreased substantially and the general quality of the fruit is low.

Source: IBGE database - SIDRA
The current weather scenario for the CY 2017 season started different from the 2016 crop scenario. In the period of June - August 2016 the trees received the necessary amount of cold weather and the trees did not experienced hail and storms. This will help the development of the fruit for the CY 2017 harvest.

Trade sources indicate that total apple production for 2017 harvest production is forecast to increase 2 percent from 2016 harvest considering the same area and considering good weather conditions.

## Consumption:

Brazilians consume fresh apples with large variations in preference depending on the region. Consumers in southern Brazil, who have been exposed to a more European style of colonization, prefer larger apples. Consumers in the central region of Brazil prefer medium-sized apples. Those in the Northeast favor smaller-sized apples. Trade contacts highlight that this wide variety of preferences within a single country equates to a market for the entire crop. According to the World Apple and Pear Association, fresh apple consumption was 3 kilos ( 6.61 lbs ) per inhabitant in 2013.

## Trade:

## Fresh apple exports

In CY2015, Brazil exported 60,112 MT of apples, a 36 percent increase compared to the same period in 2014. Apples producers focused on the external market as the prices were more competitive than compared to the internal market.

The panorama is different for CY 2016; exports declined by 49 percent between January - August as the production suffered a significant reduction. This panorama will slightly continue in CY 2017 until the apple producers recover from the downward in years due to severe unfavorable weather conditions.

## Apple Imports

## Fresh Apples

Due to the shortage of product in the market, Brazil had to import more fruit in CY2016 than compared to CY2015. According to trade statistics, the amount of imported apples rose by almost 100 percent, between January - August, reaching 82,398 MT. The situation is expected to continue in CY2017.

## Apple Juice Exports and Imports

As reported last year, apple juice exports increased slightly in 2015 when compared to 2014, the scenario changed in 2016 and apple juice exports declined as a result of the decline in the crop production. The Brazilian juice industry focuses on other fruit flavors such as grape, orange and others. Brazil also uses the apple juice domestically as an ingredient for other types of juices such as: cashew, strawberry and tangerine.

## Pear

## Production

Pear production in Brazil decreased 21 percent to $15,000 \mathrm{MT}$; this was a result of the unfavorable weather conditions that also apples producers experienced in CY 2015. Brazil in general has an insignificant pear production. Thus, the majority of demand for pears is met by imports. This small production is concentrated in the states of Rio Grande do Sul, Santa Catarina, Parana, Sao Paulo and Minas Gerais. The fruit is sold locally, mostly in small cities and with little impact on the big wholesale markets. The cost of pear production is expensive when compared to other tropical fruit available in Brazil, which does not attract new growers to this market.

## Trade

## Imports

Total pear imports were down 14 percent in CY 2015 to 179,306 MT versus 208,346 MT for the previous year.

Trade sources and U.S. cooperators indicates that Brazil is a maturing market for U.S. pears. As it is maturing, the import volume will fluctuate each season due to the external factors more so than growth in the export market from increasing consumer acceptance or familiarity of U.S. pears. The external factors are the U.S. Dollar - Brazilian Real exchange rate, the volume and prices of competitors' pears
in the market (namely Argentina and Spanish pears), the FOB prices for U.S. pears, and the confidence in the U.S. pear shippers to ship to Brazil. Another example of external factors is that U.S. pear crop manifest was full of extremely large size pears (peaking on sizes 80 's, 90 's and 70 's) and Brazil prefers the smaller to medium sized pears, which were being priced at a premium in the 2014 season. And many U.S. pear shippers are still very cautious about shipping large volumes of pears to Brazil due to past seasons' claim issues. The pears that were shipped to Brazil were still very expensive and left the importers and wholesalers with very small margins this season. This tempered their confidence in buying more volumes in the 2013-14 seasons.

Nevertheless, Brazil continues to be one of the strong markets for the U.S. pears specially the Bartlett variety which has strong acceptance in Northeast region of Brazil.

Trade sources forecast that 2016 pears imports will increase nearly 6 percent, reaching a similar volume imported in 2013. The situation is expected to follow this trend for CY 2017. The Brazilian economy and the depreciating exchange rate are the two biggest concerns and the final import number for CY 2016 and 2017 is strongly linked to that.

## Tariff Rate Table

## Grapes

## Area

Total planted area for grapes is expected to decrease by 1.8 percent to 77,510 hectares. Future investments are not expected in new areas, due to higher land values. Grapes farmers are working to increase productivity using the same area.

Total planted area for grape production

## Production

Trade sources indicate that grape production is expected to decrease 36 percent to 959,482 MT in 2016 when compared to 1.492 MMT in 2015. Trade sources forecast that grape production will remain the same or possibly increase by 1 percent in 2017. This result will be obtained considering favorable weather conditions and that growers continue in the business and invest in technology to increase yields. The dramatic reduction in production volume is a result of the unfavorable weather conditions such as low spring temperatures, high summer temperatures, and rain affected grape production.

The peak of the harvest for the export market is in May and September-November. For the domestic market, the peak harvest is April-June and September-December.

## Consumption

Post sources estimate grape consumption at 3.54 kilos ( 7.08 lbs ) per inhabitant.
Following last year's trend, there was strong growth in demand for natural grape juice (with stocks being exhausted at some wineries). As consumers seek healthier juice options and organic products, there is a trend for producers to shift to producing grapes destined for juice as opposed to wine.

## Trade

## Grape Exports

Production in Rio Grande do Sul is intended for processing, in the Northeast (Sao Francisco Valley) for exports, and the state of Sao Paulo, for table consumption.

Grape exports increased 21 percent in CY 2015 estimated at 34,385 MT, as it was a favorable year for the external market. Despite the low production, farmers decided to focus on the external market as their prices were more favorable. The situation will continue and it's expected that this volume will increase 2 percent in CY 2016, as exporters will focus on the external markets due to the economic crisis.

## Grape Imports

Post forecasts that grape imports will slightly increase in CY2016, due to unfavorable weather conditions that affected the production. CY2017 grape imports will continue to decrease as in CY 2015. Chile is the main supplier, accounting for 76 percent market share, and the Argentina market share was 11 percent.
